

ECE243 Lab 1- Part I

- We generally prefer finishing our lab preparations at least two days before the lab. This allows us some buffer time to revisit the material and clarify any uncertainties that might arise. It also provides room for unexpected challenges that may come up closer to the lab day.
- Personally, we find a mixture of in-person and online interactions to be effective. Meeting in person allows for immediate clarification and brainstorming, while online communication provides the flexibility to share resources, updates, and coordinate schedules. A balanced combination ensures effective collaboration in our lab work.
- When it comes to resolving disagreements, we prefer addressing issues as soon as they arise. Open and timely communication helps prevent misunderstandings from escalating. We are comfortable discussing concerns either in person or through messages, whichever works best for our partnership.
